

SWS-250

Visibility and Present Weather Sensor

The SWS-250 Visibility and Present Weather sensor is the most advanced of the SWS series with many of the present weather reporting capabilities of the VPF-750 Present Weather Sensor. The use of a backscatter receiver significantly improves the accuracy of present weather reporting and allows a wider range of precipitation types to be identified with confidence.

The ability to accurately distinguish frozen from non-frozen precipitation can be of significant importance in aviation applications and national weather service monitoring networks.

Visibility Measurement

The measurement of visibility by forward scatter as used by the SWS-250 is now widely accepted and seen as having significant advantages over more traditional techniques such as the use of transmissometers. Whilst transmissometers have the advantage of direct visibility measurement they are expensive to both acquire and maintain, whilst the limited measurement range restricts their use in some applications. Forward scatter sensors by contrast are compact, considerably less expensive and require less maintenance. The measurement range can extend from 10 m to 99.99 km and with a user selectable resolution of either 1 or 10

m (default), the forward scatter measurement technique is approved by ICAO for use in aviation applications.

The calibration of the SWS sensor family was undertaken in accordance with the recommendations of ICAO 9328 and is traceable to a national weather service transmissometer. The SWS-250 reports visibility as both Meteorological Optical Range (MOR) and Extinction Coefficient (EXCO).

Present Weather Measurement

The determination of precipitation type in a forward scatter sensor is made by observing the intensity of scattered light and the transit time for each precipitation particle.

These parameters are used to estimate the particle size and determine if it is liquid or frozen using well established relationships, unfortunately in anything other than still conditions the relationships become unreliable, resulting in poor classification accuracy. The sensors are the only ones to solve this problem through the use of a backscatter receiver. The ratio of forward to backscatter is significantly different for liquid and frozen particles, allowing the SWS-250 to report the correct precipitation code reliably even in the most challenging conditions.

The SWS-250 has the added benefit of enhanced present weather classification algorithms enabling the sensor to report

a wider range of precipitation types than any other sensor in the SWS family. The ability to accurately report precipitation type, especially the ability to discriminate liquid from frozen precipitation, can be very important in both aviation and national weather service monitoring network applications.

Backscatter receiver reliably determines if the particle is liquid or frozen, reporting the correct precipitation code even in the most challenging conditions.

Applications

National Observation Networks

Whilst the models used for forecasting continue to improve there remains a need for accurate measurement of current weather conditions to provide the model's input. Improvements to forecast accuracy can also be gained by increasing the number of monitoring sites but there is always a trade-off between forecast quality and cost. The SWS-250 is ideally suited to this type of application due to the accuracy of measurement, the wide range of present weather conditions reported and the cost effective design.

Aviation

In aviation there is a trend towards increasing both safety and capacity at aerodromes which can require the installation of visibility and present sensors on runways and increasingly along taxi ways. The SWS-250 meets or exceeds all international aviation specifications for visibility measurement and present weather reporting whilst offering an affordable solution for both acquisition and cost of ownership. The SWS-250 is suited to many other applications including research and road weather monitoring where the costs of deploying a dense sensor network can have a significant impact on the choice of sensor.

Interfacing, Connectivity and Cost of Ownership

The SWS sensor family is designed for easy installation by a single person and has an interface which simplifies system integration. The ASCII text data message is transmitted at user defined time periods or in response to a polled request. The standard data message provides MOR and EXCO along with

present weather codes according to both WMO Table 4680 and METAR standards. An optional interface to the ALS-2 Ambient Light Sensor simplifies use in aviation applications where both METAR and RVR information is required. The ALS-2 Ambient Light Sensor data is appended to the standard sensor data message simplifying both installation and data processing

ALS-2 Ambient Light Sensor

Advanced Diagnostics

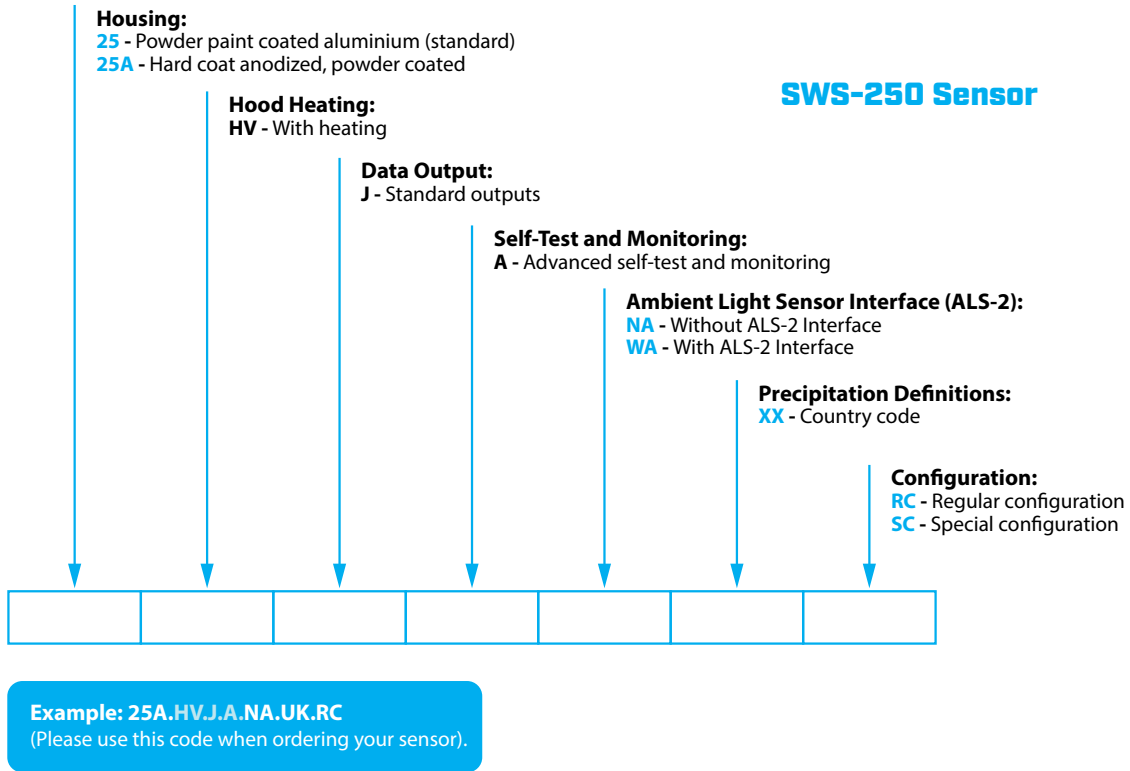

To keep track of the operational status of the sensor, abbreviated self-test information is included in every data message with a full selftest report available on request. Self-test features include window contamination monitoring which automatically corrects the output data and provides two stage warnings allowing maintenance to be performed most efficiently. Calibration checks and recalibration are simple and quickly accomplished in the field by a single person. The need for such procedures is limited however as the stability of the light source and receiver circuitry is such that recalibration intervals are typically measured in years. The SWS-250 is DC powered with the capability to accept separate supplies for sensor electronics and the high power hood heaters. Hood heating is only required in regions where blowing snow is encountered. To conserve power the heaters are fully automatic and activate at 2 °C and switch off at 4 °C.

Advanced Functional Test Mode

All Biral visibility and present weather sensors have the capability to temporarily output specific data via a test mode. In this mode the user can define visibility, present weather, window contamination and fault conditions for a pre-determined time period. This functionality is useful during Factory or Site Acceptance Testing (FAT or SAT), or system integration to test downstream processing of the output data.

Sensor Configuration Information

For a detailed explanation of the configuration options please refer to the table below.

Configuration Options Explained

Option	Description
Housing Options	The sensor enclosure is aluminium, it is corrosion protected using either a chemical conversion coat with a powder coat paint finish or hard coat anodizing and a powder coat paint finish. The hard coat anodized with paint finish is recommended for offshore and marine environments. Option 25: Powder coated aluminium (standard) Option 25A: Hard coat anodized, powder coated
Heating Options	Heated hoods are available to stop snow from accumulating around the optical window. The hood heating option is only required in regions where snow is experienced. Option HV: Hood heating included
Data Output	The sensor has RS232, RS422 AND RS485 serial output capabilities. No other options are available. Option J: Standard outputs
Self-Test and Monitoring	The sensor is provided with Advanced Self-Test capability. Advanced self-test capability provides monitoring of all the essential sensor functions, contamination of the transmitter window, plus receiver window contamination monitoring and receiver sensitivity monitoring. Advanced self-test capability provides greater measurement confidence in applications where different levels of contamination may occur on the sensor windows, for example where strong or gusty winds are experienced. No other options are available. Option A: Advanced Self-Test
ALS-2 Interface	The sensor may be configured to allow direct connection of the ALS-2 Ambient Light Sensor. The Ambient Light Sensor is typically used in airport applications where Runway Visual Range (RVR) must be calculated. Option NA: Without Ambient Light Sensor Interface Option WA: With Ambient Light Sensor Interface
Precipitation Codes	Biral present weather sensors report precipitation and visibility according to predefined intensity values. As no universal definition for intensity values is available, sensors can be supplied configured to the requirements of a range of countries or the customer may supply their own definitions. Where custom definitions are required please complete a Custom Present Weather Definition Form, available from our Sales Department (enquiries@biral.com). for a full list of the currently available country codes please refer to the Present Weather Sensor County Code List, available from our Sales Department (enquiries@biral.com) or as a download from the SWS-250 product page of our website (www.biral.com).
Configuration	Reserved for customer specific configurations. Option RC: No customer specific configuration Option SC: Special customer specific configuration

Visibility and present weather measurement

Measures	visibility and present weather (MOR & EXCO)	
Output	Serial data	
Range (visibility)	Default 10 m to 99.99 km	
Measurement error	≤ 4.2 % at 600 m ≤ 6.8 % at 5 km ≤ 12.3 % at 15 km ≤ 17.1 % at 25 km	≤ 5.1 % at 2 km ≤ 9.6 % at 10 km ≤ 14.8 % at 20 km ≤ 19.4 % at 30 km
Measurement resolution	1 m or 10 m (default)	
Measurement principle	Forward scatter meter with 39° to 51° angle, centred at 45°	
Precipitation detection threshold	Rain: 0.015 mm/hr Snow: 0.0015 mm/hr	(0.0006 in/hr) (0.00006 in/hr)
Precipitation Intensity Reporting Range	0 - 1000 mm/hr	(39.4 in/hr)
Rain intensity accuracy	≤ 5%	

Outputs and reports

Output rate (seconds)	10 to 300 (selectable)
Serial outputs	RS-232, RS-422 and RS-485
WMO Codes	42 Table 4680 codes
METAR Codes	36 present and past weather

Power requirements

Sensor power	9 - 36 V DC (Mains power adaptor available)
Hood heating power	24 V AC or DC
Basic sensor	3.5 W
Window heaters	2.5 W
Hood heaters	36 W

Additional features

Hood heaters	fitted as standard
Window contamination monitoring	fitted as standard
Window heaters	fitted as standard to all sensor head windows

Environmental

Operating temperature	-40 °C to +60 °C
Operating humidity	0 to 100 %RH
Protection rating	IP 66 / IP 67

Certification & compliance

CE Certified	
EMC compliance with EN61326-1997, 1998, 2001	
RoHS and WEEE compliant	

Physical

Material	Aluminium. Powder paint finish, with optional hard anodize base layer.
Weight (including mounting kit)	4.5 kg
Length	811 mm
Warranty	3 years
Lifetime	> 10 years

Maintenance

Self-test capability	as standard
User confidence check	6 months (recommended)
Window cleaning	automatic compensation and warnings
Field calibration	with optional calibration kit

Included with sensor

The sensor is delivered in sturdy recyclable foam filled packaging with:

- Pole mounting kit (2 x U-bolt)
- User manual and calibration certificates

Accessories – optional

00.SWS.CABLE-D	SWS series data cable per meter
00.SWS.CABLE-P	SWS series power cable per meter
SWS.CAL	SWS series calibration kit
SWS.CASE	SWS series transit case
SWS.WTY200	SWS 200 Spares Kit
SWS.WTY250	1 Year extended warranty
PW.CODE	user defined precipitation definitions; per definition set
PW.MAINS	Mains power adaptor

Specifications are subject to review and change without notice. E&OE.
